## Essentials of Calculus <br> Homework 5.1 <br> Velocity and distance

1. In $t$ minutes, a snail's velocity will be $f(t)=3+2 t^{2}$ inches $/ \mathrm{min}$. Use a Riemann sum with $n=4$ and left endpoints to approximate how far the snail travels in the next 2 minutes. (Note that $\Delta t=1 / 2$.)

Numeric answer: The snail travels about 9.5 feet.
2. In $t$ hours, water is poured into a pool at a rate of $f(t)=30+10 t^{2}$ gallons/hour. Use a Riemann sum with $n=4$ and right endpoints to approximate how much water is poured into the tank in the next 1 hour.

Numeric answer: About 38.75 gallons of water is poured into the tank.
3. The velocity of a car in $t$ hours is given by the following table.

| $t$ (hours) | 0 | 2 | 4 | 6 | 8 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $f(t)$ (mile/hour) | 50 | 70 | 100 | 120 | 140 |

a) Use left endpoints to approximate the distance traveled over the next 8 hours.

Numeric answer: The care travels about 680 miles.
b) Use right endpoints to approximate the distance traveled over the next 8 hours.

Numeric answer: The care travels about 860 miles.
4. The rate at which a mutant spider gains weight is given by the following table.

| $t$ (minutes) | 0 | 15 | 30 | 45 | 60 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $f(t)(\mathrm{kg} /$ minute $)$ | 1 | 2 | 5 | 10 | 14 |

a) Use left endpoints to approximate the weight gained over the next 60 minutes.

Numeric answer: The spider gains about 270 pounds.
b) Use right endpoints to approximate the weight gained over the next 60 minutes.

Numeric answer: The spider gains about 465 pounds.
5. Let $f$ be the function with the following graph:

Use a Riemann sum with $\Delta x=1$ to approximate the area under the graph. (Use either left or right endpoints.)

Numeric answer: With left endpoints, the approximation is about 19.3 square units. With right endpoints, the approximation is about 24.3 square units.
6. Let $f$ be the function with the following graph:

Use a Riemann sum with $\Delta x=1$ to approximate the area under the graph. (Use either left or right endpoints.)

Numeric answer: With left endpoints, the approximation is about 10.5 square units.
With right endpoints, the approximation is about 8.5 square units.
